Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

N.Alternate names: guanyloribonuclease, ribonuclease Sa3
C.Species: Streptomyces aureofaciens
C.Date: 30-Sep-1993 #sequence_revision 02-Dec-1994 #text_change 09-Jul-2004
C.Accession: JC1287

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 4

G70587

hypothetical protein Rv2376c - Mycobacterium tuberculosis (strain H37RV)

G;Species: Mycobacterium tuberculosis

G;Date: 17-Jul-1998 #sequence_revision 17-Jul-1998 #text_change 09-Jul-2004

G;Accession: G70587

G;Accession: G70587

R;Onlor, R.; Parkhill, J.; Garnier, T.; Churcher, C.; Harris, D.; Gordon, S.; Connor, R.; Rogers, J.; Rutter, S.; Seeger, K.; Skelton, S.; Hamlin, N.; Holroyd, S.; Mathors: Sqares, R.; Sulston, J. B.; Taylor, K.; Whitehead, S.; Squares, S.

Efficient secretory production of foreign proteins e.g. transglutaminase employing transformant coryneform bacterium, simply on industrial scale with direct recovery for use in food processing and pharmaceutical industry.

Japanese. Claim 7; Page 77; 151pp $\mathbf{b}_{\mathbf{c}}$ 

This invention relates to a process for the production of a foreign secretory protein through the construction of a recombinant coryneform bacterium. The coryneform bacterium is transformed with an expression construct in which DNA encoding a target foreign protein pro-structure is ligated to the downstream region of DNA encoding the signal peptide domain of a coryneform bacterial protein. Following transformation with the vector, the bacterium is cultured, and the pro-peptide cleaved from the expressed protein. Transglutaminases produced using this process are useful in the food processing and pharmaceutical industries. The present sequence represents a Corynebbacterium ammoniagenes SIPA peptide, which is used in the method of the invention

```
The present invention describes a transformed Corynebacterium having an expression gene structure comprising a promoter sequence followed by a nucleic acid sequence encoding a region containing a signal peptide derived from Corynebacterium, followed by a nucleic acid sequence encoding human epidermal growth factor (hESF). Also described is a method for the preparation of hEGF in which the above transformed Corynebacterium is cultured to produce and secrete human EGF and then specifically claimed signal peptide derived from Corynebacterium specifically claimed signal peptide derived from Corynebacterium ammoniagenes, which is used in the exemplification of the present
                                                                                                                                        Corynebacterium; human epidermal growth factor; hEGF; human; epidermal growth factor; signal peptide; Corynebacterium ammoniagenes.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Preparation of human epidermal growth factor and a transformed Corynebacterium used to produce the epidermal growth factor.
                                                                                                        Corynebacterium ammoniagenes signal peptide SEQ ID NO:3.

                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method for producing a foreign protein by culturing a mutant strain of a coryneform bacterium that contains an expression gene construct to secrete the foreign protein, followed by recovery of the produced foreign protein. The gene construct is obtained by ligation of a nucleic acid encoding a signal peptide domain originating from a coryneform bacterium, to downstream of a functioning promoter sequence in the coryneform bacterium and also by ligation of a nucleic acid encoding a foreign protein, to downstream of a nucleic acid sequence encoding the signal peptide. The method is useful for the production of a foreign protein which is applicable in producing e.g. industrially-useful transglutaminase and human epithelial growth factor for use in medicine, cosmetics and food processing. This sequence represents a coryneform bacterium protein of the invention
                                                                                                                                                                                                                                                                                                                                                                       Coryneform bacterium; signal peptide domain; food processing; medicine; cosmetic; transglutaminase; human epithelial growth factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Secretion production of foreign proteins by culturing transformant coryneform bacteria, applicable in producing e.g. industrially-useful transglutaminase and human epithelial growth factor.

                                                                                                                                                                           The present sequence represents a cell surface layer protein, and is isolated from Corynebacterium ammoniagenes ATCC6872. A gene of interest can be inserted downstream of the present sequence. Subsequent expression of the gene by the microbe causes it to be secreted extracellularly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel polymucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analyzing expression profile or pattern of a gene and identifying homologous gene.

The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium, and shenifying a homologue of a gene derived from coryneform bacterium, saccharides are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids,
The present invention provides a number of nucleotide and protein are quences from the Corynaform bacterium Corynabacterium glutamicum. These are useful for identifying the matarion point of a gene derived from a mutant of corynaform bacterium, meaturing expression amount and analysing the expression profile or expression pattern of a gene derived from corynaform bacterium, and identifying a homologue of a gene derived from corynaform bacterium, and identifying a homologue of a gene derived from corynaform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the Buropean Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analyzing expression profile or pattern of a gene and identifying homologous gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Yokoi H;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Coryneform bacterium, amino acid synthesis, vitamin, saccharide, organic acid synthesis.

                                                                                                                      A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, TDRAB. The immunogenic polypeptide can be used to diagnose M.tuberculosis infection by forming complexes with specific antibodies in the sample. Fragments of DNA encoding the immunogenic polypeptide can be used as diagnostic primers or probes and agents that bind to the antigen, especially monoclonal antibodies or equivalent polyclonal antibodies, are also used for diagnosis
New immunogenic polypeptide (s) from soluble M. tuberculosis antigens useful for diagnosis of M. tuberculosis infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Thrab. It is encoded by a DNA sequence (see AAV44359) isolated from a M. tuberculosis strain H37Ra expression library with rabbit anti-sera raised against M. tuberculosis supernatant. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAW64291-W64379) comprising an antigenic portion of a soluble M. tuberculosis antigen, or an immunogenic portion of a bolypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using the above polypeptides, antibodies, or oligonucleotide probes and primers, for the diagnosis of tuberculosis.                                                                                                                                                                                                                                                                                                                                                      A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, TDRAB. The immunogenic protein, and fusion proteins containing one or more of the proteins plus ESAT-6, are useful in vaccines, preferably when formulated with a non-specific adjuvant, to induce an immune response against M.tuberculosis (for treatment or

nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel recombinant antigens and their encoding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents an immunogenic portion of a soluble Mycobacterium tuberculosis (MT) antigen which can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Immunogenic Mycobacterium tuberculosis polypeptide(s) and DNA - used to develop products for the detection of M. tuberculosis infection and for diagnosis, treatment and prevention of tuberculosis.

                                                                                                                                                                       The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's. M. tuberculosis Ag's. M. tuberculosis Ag's. M. tuberculosis Ag's. DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretion by, T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AAZ19299 to AAZ19460 and AAX39083 to AAX39225 are used in the exemplification of

immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or conservative aubstitutions and/or modifications). The present sequence represents a specifically claimed my tuberculosis antigen, DPAS (in the specification claim 3 specifies the DNA sequences however the present sequence represents the protein sequence, which can be compared with AAM73465 from a similar specification). The immunogenic polypeptide can be used to diagnose specifications infection by forming complexes with specific antibodies in the sample. Fragments of DNA encoding the immunogenic polypeptide can be used as diagnostic primers or probes and agents that bind to the antigen, especially monoclonal antibodies or equivalent polyclonal antibodies, are also used for diagnosis. N.B. The present sequence represents the protein sequence, not the DNA as specified
immunogenic polypeptide(s) from soluble M. tuberculosis antigens tul for diagnosis of M. tuberculosis infection.

ö
A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, DPAS. The immunogenic protein, and fusion proteins containing one or more of the proteins proteins of the proteins plus ESAP.-6, are useful in vaccines, preferably when formulated with a non-specific adjuvant, to induce an immune response against M.tuberculosis (for treatment or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This polypeptide comprises the Mycobacterium tuberculosis antigen DPAS. A bunk sequence (see AAV44314). Coding for DPAS was isolated from a M. tuberculosis genemic library. An Verminal peptide (see AAV64346) of DPAS was shown to induce proliferation and interferon-gamma production in peripheral blood monounclear cells. DPAS shows sequence homology yo a Mycobacterium leprae protein. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAW64291-W64379) comprising an antigenic portion of a soluble M. tuberculosis antigen, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting N. tuberculosis infection in a patient using these polypeptides, antibodies or oligonucleotide probes and primers, for the diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated Mycobacterium tuberculosis polypeptides and DNA - used to develop products for the detection of M. tuberculosis infection and diagnosis of tuberculosis.

The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's. M. tuberculosis Ag's, DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cyrokine secretion by, T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AAZ19446 to AAZ19460 and AAY19083 to AAY39225 are used in the exemplification of the present invention
                                                                                                                                                                                          New antigens from Mycobacterium tuberculosis useful in diagnostic skin tests and protective or therapeutic vaccines or compositions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel Mycobacterium tuberculosis secreted polypeptides and polynucleotides useful in diagnosis, treatment and prophylaxis of tuberculosis.
                                                                                    Campos-Neto A, Houghton I, Hendrickson RC;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a novel method for identifying essential genes for survival or virulence of mycobacteria species. The method comprises aligning the genomic sequence of a first mycobacterium species on a genomic sequence of a second mycobacterium species and selecting a polynuclectide sequence that is highly conserved in both genomes with no counterparts in other bacterial genomic sequences and that corresponds to an essential gene for the survival or virulence of mycobacterium species. The method of the invention is useful for detecting M. tuberculosis or M. leprae infection. The method reduces the number of potential new targets and procective antigens for new drugs and vaccine compositions to treat and prevent mycobacterial diseases, particularly tuberculosis and leprosy. The present sequence represents a marker protein from Mycobacterium tuberculosis and Mycobacterium leprae identified using the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying and selecting genes for survival or virulence of mycobacteria by a comparative genomic analysis of the sequences of Mycobacterium tuberculosis and M. leprae.
             The present invention relates to Mycobacterium tuberculosis secreted proteins (MTSP), where the polypeptide has M. tuberculosis specific antigenic and immunogenic properties. Compositions of the invention may be useful for diagnosing Mycobacterium tuberculosis infection and as a vaccine against M. tuberculosis infection
                                                                                                                                                                                                Gaps

A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M:ubberculosis antigen, TDRa1. The immunogenic polypeptide can be used to diagnose M:tuberculosis infection by forming complexes with specific antibodies in the sample. Fragments of DNA encoding the immunogenic polypeptide can be used as diagnostic primers or probes and agents that bind to the antigen, especially monoclonal antibodies or equivalent polyclonal antibodies, are also used for diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0;

This sequence represents an immunogenic portion of a soluble Mycobacterium tuberculosis (MT) antigen which can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of tuberculosis
                                                                                                                                                                                                                                                           Immunogenic Mycobacterium tuberculosis polypeptide(s) and DNA - used to develop products for the detection of M. tuberculosis infection and for diagnosis, treatment and prevention of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Houghton R;

                                                                                                                                                                                                                                                        g
                                                                                                                                                                    ਨੇ
                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                             This polypeptide comprises Mycobacterium tuberculosis soluble antigen the reached by a DNA sequence (see AAV44339) isolated from a M. tuberculosis strain H37Ra expression library with rabbit anti-sera raised against M. tuberculosis supermatant. No significant homology was found between TDRa1 and Genebank database sequences. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAW4291 W64379) comprising an antigent portion of a tuberculosis antigen, or an immunogenic portion of an W. polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using the above polypeptides, antibodies, or oligonucleotide probes and primers, for the diagnosis of tuberculosis. (Updated on 17-OCT-2003 to standardise OS

Also described are vaccines and fusion protein containing M tuberculosis Ag's. My tuberculosis Ag's. DNAs encoding them, derived fusion proteins and other oblypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce profiferation of, or cytokine secretion by, T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AB219249 to AAZ19460 and AAX39083 to AAX39225 are used in the exemplification of
This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antigens from Mycobacterium tuberculosis useful in diagnostic skin tests and protective or therapeutic vaccines or compositions.

                                                                                                                                                                                                                                                                                                                                              8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           designated ORF (open reading frame) 1-4534, and sequences ABP31028-ABP35561 represent 014534, and sequences ABR75054

designated ORF (open reading frame) 1-4534, and sequences ABR75054

ABR79587 represent COMAs encoding them. The invention also encompasses
polypeptides at least 80% identical to the CRI-ORR4534 (collectively
referred to as ORFX) proteins, polymucleotides at least 85% identical to
the ORFX nucleic acid sequences, vectors and host cells comprising ORFX
polymucleotides, the recombinant production of ORFX proteins, antibodies
specific for ORFX proteins, methods of detecting ORFX polymucleotides and
polypeptides, methods of screening for modulators of ORFX expression or
activity, and methods of screening individuals for a predisposition to an
ORFX-associated disorder. The ORFX proteins of the invention have a wide
range of biological activities, such as cytokine, cell proliferation,
tissue growth, anglogenesis, activin or inhibin activity, chemotactic/
chemokinetic activity, haemostatic activity, thrombolytic activity,
receptor/ligand, antinflammatory activity, thrombolytic activity,
receptor/ligand, activity, and may also be involved in the determination
of bodily characteristics, fertility and behaviour. ORFX proteins,

cutter actual and autocourses may be used in the treatment to canners, neurological disorders such as psoriasis and benign tumours, neurological disorders such as epilepsy and Alzheimer's disease, cardiovascular diseases, indument system disorders, disorders related to organ transplantation, disorders of tissue growth and regeneration, diseases such as diabetes mellitus, hypothyroidism, and cholesterol ester storage disease, and infectious diseases caused by Yiral, bacterial, cardiore of primers and infectious diseases caused by ORFX genomic sequences or transcripts, in the identification and cloning of homologous or transcripts, in the identification and cloning of homologous or transcripts, in the identification and cloning of homologous sequences, in genetic diagnosis, and in forensic biology. The ORFX nucleic acids may additionally be used to produce transgenic animals which may be useful for studying the function and/or activity of ORFX protein, and in drug screening. The ORFX proteins may also be used as immunogens to generate specific antibodies, which are useful in the immunogens, treatment and monitoring of ORFX-associated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel polynucleotides derived from Coryneform bacteria, for identifying

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            14-SEP-2000; 2
         coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the Buropean Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     immunosuppressive; antiarthritic; antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; nootropic; neuroprotective; antibacterial; virucide; fungicide; opthalmological; gene therapy; channel/transporter protein; rheumatoid arthritis; neoplasm; cardiac arrest; cerebrovascular disorder; cerebral ischemia; anglogenesis; nervous system disorder; Alzheimer's disease; conclar disorder; cerebral ischemia; epithalial cell proliferation; wound healing; chemotaxis; food additive.
                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protein encoded by novel human channel/transporter gene #268 clone

(HUMA-) HUMAN GENOME SCI INC.

Ruben SM Barash SC,

Isolated nucleic acid molecule encoding a channel/transporter protein is used in preventing, treating or ameliorating a medical condition.

Claim 11; SEQ ID NO 964; 809pp; English.

The invention relates to an isolated nucleic acid molecule encoding a channel/transporter protein or sequences at least 95% identical to a channel/transporter protein or sequences at least 95% identical to a channel/transporter protein or sequences by them are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used to display a pathological condition or susceptibility to a least of pathological condition. The antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunosasays e.g. radioimmunosasays or enzyme linked immunosorbent assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. carchiac arrest, cerebrovascular disorders e.g. cerebral isohemia, andiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain cell proliferation, to prevent skin aging due to sunburn, to maintain also be used as a food additive or preservative to increase or decrease sucrees capabilities. This sequence corresponds to a protein of the

The invention relates to an isolated polymucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polymucleotides (BMM35524-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a polympeptide of the invention, antibodies against polypeptides of the invention; animune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acnes polypeptides, polympeptide and an isolated T cell population comprising P. acnes polypeptides, via this method; a vaccine composition (comprising P. acnes polypeptides, this method of a vaccine composition of comprising P. acnes polypeptides, dusting the presence or absence of P. acnes in a patient, and a method for inhibiting the development of P. acnes in a patient, and a method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for disgnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes for nucleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P. acnes, or for treating acnessed and the kit is useful for performing a diagnositic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acnes polymucleotides of the invention. Note: The sequence data for this patent did not form part of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders in nothing aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in cappostible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG3037 represent novel human diagnostic amino acid sequences. ABG00010-ABG3037 represent novel human diagnostic parent did not appear in the printed specification, but was obtained in electronic format directly from WIND at

The invention describes an isolated or recombinant polypeptide (I), having 50% or more identity to 190 300-1200 residue amino acid sequences (SI), given in the specification, over a region of 100 or more residues and the polypeptide as thermostable xylanase activity. (I) is useful for dough conditioning; beverage production; as a nutritional supplement in animal feed; reducing lignin in a wood or a wood product; and for eliminating and protecting animals from a microorganism comprising or the polymocleotide (II) enceding (I) is useful for amplifying nucleic acid encoding a polypeptide having a xylanase activity which involves amplifying (II) or its subsequence. (I) is useful for treating and preventing bacterial infection and fungal infection e.g. coccidiosis. This is the amino acid sequence of a xylanase protein isolated from an
                                                                                                                                                     antibacterial; fungicide; thermostable xylanase activity; dough conditioning; beverage production; nutritional supplement; animal feed; lignin reduction; wood product; xylan; bacterial infection; fungal infection; coccidiosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a recombinant DNA construct comprising a promoter functional in plants operably linked to an oil-associated gene. The construct is useful for transgenic plant seed which has in its genome the construct, that is functional in the plant to transcribe the oil associated gene. The transgenic plant seed grows into a plant having enhanced seed oil as compared to wild type. The construct is useful for producing hybrid maize seed. The transgenic plant seed is useful for producing vegetable oil. The present sequence represents the amino acid sequence of an oil-associated gene related protein.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid condaining the vector; (3) an isolated condition of the properties of the containing the vector; (3) an isolated condition of the properties of producing the polypeptide; (5) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway required for proliferation, (7) identifying a compound that influences the activity of the paper product or that has an activity against a biological pathway required for proliferation, or that that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation of the biological pathway required for proliferation, or that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound sactivity; (11) a culture comprising strains in which the gene product lies or a gene on which the test compound that inhibits proliferation of an organism of the action of an organism. The antisense nucleic acids are useful for the callular proliferation of an organism. The antisense nucleic acids are useful for the callular proliferation of an organism. The antisense nucleic acids are useful of an organism or produce and organism or produced a compound that inhibits the form of the callular proliferation of an organism. The antisense nucleic acids are useful for an organism or for erreaning to choose and a serior or an endingence and a compound and a captured for capture and an organism or produced a condition of an organism or the proliferation of an organism or the capture and an organism or the proliferation of an organism or the proliferation of an organism or the antisense and the areal and an organism or the antisense and the areal and an or drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

Claim 25; SEQ ID NO 66333; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) an bost cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway or required for that has an activity against a biological pathway or equired for proliferation, or that inhibits cellular proliferation of an organism acts agene product lies or a gene on which the test compound that inhibits proliferation of an pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the extent of compound's activity; (11) a culture comprising strains in which the compound that inhibits the proliferation of an organism. The antisense nucleic acids required for cellular proliferation to isolate candiate molecules for rational drug discovery programs, or for screening for homologous nucleic acids required for the proliferation to isolate candiate molecules for rational drug discovery programs, or for screening homologous nucleic acids are useful for the trarget prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed sequences

C the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed for sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel method for the fermentative production of methionine by growing a sulphur-producing Coryneform bacteria that expresses at least one heterologous mucleic acid encoding a protein with methionine synthase (MetH) activity. Methionine accumulates in the medium cor the cells. The method can be used to produce an L-methionine.

Cortaining animal feed additive by culturing an L-Met-producing microorganism, removing water from the resulting broth, removing 0-100% of the biomass formed and drying the product to produce the feed additive in powdered or granular form. The nucleic acid encoding MetH has sequence of homology less than 100% with respect to the meth coding sequence of corynebacterium glutamicum ATCC 1303. Optionally at least one other gene in the methionine biosynthesis pathway (e.g. aspartate kinase, corynebacterium glutamicum ATCC 1303. Optionally at least one other gene in the methionine biosynthesis pathway (e.g. aspartate kinase, corynebacterialenyde-3-phosphate dehydrogenase or 3-phosphately kinase) is also amplified or mutated so that it is not affected by metabolites. Also at least partly switched off (e.g. homoserine Kinase, threonine is corpusate partly switched off (e.g. homoserine Kinase, threonine corpusation) generally sublumr-containing fine chemicals are useful in human and additive for animal feeds. More animal mutation
                                                                                                                                          .;

The first sense sequences given in the specification where expression of the 613 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, (7) identifying a compound that influences the activity of the gene in an operon required for the proliferation or that has an activity against a biological pathway in which a proliferation or that inhibits cellular proliferation of an identifying a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, sactivity; (11) a culture comprising strains in which the gene or proliferation of the strains is present in a culture or collection of the strains; or (13) identifying the target of a compound that inhibits the collection of strains; or (13) identifying the compound that inhibits the collection of an organism. The antisense nucleic acids required collection of contribing proteins or screening to modeled acids required collection of collection or cellular proliferation to insolate candidate molecules for rational culture decides and sequence collection acids actions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid comprising any one of

ö
the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway tequired for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antisense nucleic acids, useful for identifying proteins or screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 invention relates to an isolated nucleic acid comprising any one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense; prokaryotic essential gene; cell proliferation; drug design.

or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this captent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed at 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PRO; PRO1081; PRO1274; PRO10272; proliferation, T-lymphocyte; PRO1199; PRO156; PRO4401; PRO10268; inhibition; stimulation; infiltration; MR PRO156; PRO4401; PRO10268; inhibition; stimulation; infiltration; continuous ereli; cosinophil; Prythem multiforme; inhibitionme; polymorphonuclear neutrophil; Prw inthody; immune-related disorder; systemic chornic arthritis; spondyloarthropathy; systemic sclerosis; diopathic inflammatory myopathy; Sjogren's systemic sclerosis; which is arcoidosis; autoimmune haemolytic anaemia; asthma; systemic vasculitis; sarcoidosis; autoimmune haemolytic anaemia; asthma; systemic vasculitis; sarcoidosis; autoimmune haemolytic anaemia; asthma; suttender enal disease; demyelination; central nervous system; idiopathic demyelinating polymeuropathy; menune-mediated renal disease; damyelination; cartral nervous system; dispathic demyelination; cirrhoais; allargy; duilain-Barre syndrome; hepatobiliary disease; contopilic pneumonia; chronic active hepatitis; sclerosing cholangitis; food hypersensitivity; inflammatory bowel disease; gluten-sensitive enteropathy; urticaria; minflammatory bowel disease; gluten-sensitivity pneumonitis; polymeuropathy; psoriaeis; atopic dermatitis; hyporsensitivity pneumonitis; contact dermatitis; contact dermatitis; practice rejection; graft-versus-host disease.

The sequences given in AAB47291-99 show PRO polypeptides. PRO1081, PRO1274 and PRO10272 stimulate the proliferation of T-lymphocytes and PRO1276, PRO4401 and PRO10268 inhibit the proliferation of T-lymphocytes. PRO1754 and PRO1912 act to enhance the infiltration of T-lymphocytes. PRO1754 and PRO1912 act to enhance the infiltration of monounclear cells, eosinophils or polymorphonuclear neutrophils (PWN) into the tissue of a mammal. The PRO CDIM's and antibodies which bind to them, are used to treat an immune-related disorder in a mammal. Such disorders include systemic lupus errythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, a spondyloarthropathy, systemic vasculitis, sarcoidosis, autoimmune haemolytic canaemia, autoimmune thrombocytopaemia, thyroiditis, diabetes mellitus, immune-mediated renal disease, a demyelinating polymeuropathy, a happatobiliary disease infectious or autoimmune chronic active hepatitis, primary bilary disease, infectious or autoimmune chronic active hepatitis, primary bilary disease, infectious or autoimmune chronic canaemity, and hipples disease, an autoimmune mediated skin, disease, an autoimmune or immune-mediated skin, disease, asthma, allergic rhinitis, atopic disease of the lung, eosinophilic pneumonia, idiopathic pulmonary fibrosis, thypersensitivity urticaria, an immunologic disease, chypersensitivity pneumonia, alloapathic pulmonary fibrosis, hypersensitivity pneumonia, alloapate a mannel action associated disease, graft rejection or graft-versus-host disease Isolated PRO polypeptide useful for treat or diagnose an immune-related disorder e.g. arthritis, asthma, allergy, diabetes or psoriasis. Claim 1; Fig 14; 124pp; English
